Coastal/Industrial Environments

More frequent cleaning is necessary and the maximum period between cleaning should never be more than three (3) months.

Under the worst conditions involving heavy grime deposition and atmospheric pollution (e.g. sulphur compounds or salts) more frequent cleaning is advisable e.g. monthly, if deterioration of the coating is to be prevented.

The cleaning of powder coated and anodised material should be performed using hand cleaning and rinsing techniques. This should be achieved by using small amounts of clean water and recommended cleaning products.

Do not under any circumstances use an abrasive type of cleaning agent as this will severely damage the surface of the material. Hosing must be avoided under all circumstances. Dry preferably with a chamois, or alternatively, a soft cloth.

The cleaning of the product should be performed at a time that will allow the aluminium to dry quickly, preferable early in the morning.

We recommend the use of the following automotive cleaning products.

- Kitten "Glo-Wash"
- Turtle Wax "Zip Wash"
- RE-PO "Superwash"

Should the above products give less than the desired results, the following car polishes can be used as per the manufacturer's recommendation.

- Turtle Wax "Car Polish"
- RE-PO "Car Cream Polish"

NOTE Use only the above mentioned cleaning products. Do not use alternative products by the same or other (manufacturers) without written authorization from Westal Windows.

Maintenance of Powder Coated & Anodised Aluminium

Cleaning is necessary if the fine finish of powder coated and anodised aluminium is to be preserved. Deterioration of the coating occurs mainly as a result of grime deposition and attack by contaminated moisture which in a coastal environment contains salt and sulphur compounds.

Deposited grime and contamination absorbs moisture like a sponge and holds it against the powder coated and anodized surfaces. This permits the attack to proceed thereby damaging the coating which cannot be restored.

Frequency Of Cleaning:

Cleaning required is dependent on the severity of the environment

Rural/Suburban Environments

The maximum period between cleaning should never be more than six (6) months.
